Title: **Addressing Menopausal Problems among
Endometrial Cancer Survivors: Unmet need of Cancer Care**

Introduction

- An individual is considered a **cancer survivor** from the time of diagnosis through the balance of his or her life.
- Management of cancer survivors is primarily focused on detection of disease relapse and treatment.
- The long-term effects of cancer treatment like menopausal symptoms, bone health issues which are important components of survivorship care are usually overlooked.

Objectives : To evaluate menopausal symptoms and bone health among endometrial cancer survivors.

Materials and Methods:

- A cross-sectional study
- 31 endometrial cancer patients post-treatment and disease-free for atleast 1 year.
- Menopausal symptoms were assessed using Menopausal Rating Scale and BMD was assessed by DXA scan.
- Descriptive data analysis was done

Conclusion

Routine assessment and tailored interventions can enhance survivorship care, ensuring not only the successful management of cancer but also addressing the broader spectrum of challenges these individuals face post-treatment
